# Introduction

This document describes **basics** for installation of Apexi PowerFC FD3S Version for FD series I~III build from 10.91 to 12.95 into second gen. RX-7 Series4 and Series5 Turbo.

*Please use all the Information provided on this document at your own risk. I will not cover any damages or faults which may result. You will require deep mechanical and electrical skills to perform this modifications. The installation will require modifications to your electrical engine control system, which can cause damage to your car components or the engine from improper installation or use. If you are not common to electrical installations or you don't understand any of described points, do not perform any changes! In this case please ask your preferred workshop about the modifications described here.*

This installation is recommended to all, who use aftermarket turbo set-up. You will loose the twin-scroll function from your series4 by following this write up.

I have performed the installation by myself to my cars and all my setups are working very well. My first car is a series4 Japanese spec. FC3S with HKS T04E turbo installed, now upgraded to T04S.

My second car is a series5 Japanese spec. FC3S with HKS T04R turbo installed.

The installation of Apexi PFC FD version into Series4 is slightly different as the installation into Series5. The reason for this is the wiring and different ECU pin- out of both versions. The installation into Series5 is more easy as for series4. We will need to split this document into Series4 and Series 5 section.

Version	Changes note	Date	by:
1.0	Initial release	October 20, 2006	Iwan Keller
1.1	See version history	January 28, 2007	Iwan Keller

## Series4

Before we can begin, we need following parts for our modifications

### **Parts needed:**

- Apexi PFC FD3S I~III version made between 10.1991 and 12.1995
- FD3S Water-Temp sensor and connector
- FD3S Air-Temp sensor and connector
- FD3S wiring loom and connector for slot1 of the Apexi ECU found in FD3S or Series5 FC3S.  
You can also use wiring-adapter like on the picture bellow.
- FD3S igniter
- FD3S MAP sensor or GM 3BAR map- sensor
- 4x 10 OHM resistors with at least 10 Watts

### **Sensors:**

First you should remove your I/C and the UIM to get access to the sensors and the wiring loom. Replace the water-temp sensor with the FD sensor. Remove your air-temp sensor and replace with the FD sensor (you will need to tap new thread as the FC thread is something like M8x1,0 and the FD is M8x1,25)

Version	Changes note	Date	by:
1.0	Initial release	October 20, 2006	Iwan Keller
1.1	See version history	January 28, 2007	Iwan Keller

## FC Pinout:

You will need to make a new wiring loom or solder the original pins from your old ECU. Let us take a look at the ECU pin- out, and what each pins is used for:

FC ECU #1 SERIES4													
1W	1U	1S	1Q	1O	1M	1K	1I	1G	1E	1C	1A		
1X	1V	1T	1R	1P	1N	1L	1J	1H	1F	1D	1B		

FC ECU #2 SERIES4									
2Q	2O	2M	2K	2I	2G	2E	2C	2A	
2R	2P	2N	2L	2J	2H	2F	2D	2B	

FC ECU #3 SERIES4					
3I	3G	3E	3C	3A	
3J	3H	3F	3D	3B	

1A	Diag
1B	Diag
1C	Air-Bypass- Relay
1D	Diag
1E	A/C Switch
1F	A/C Relay
1G	Neutral- Switch
1H	Water-temp-sensor
1I	5-th gear switch
1J	Initial-Set Coupler
1K	Change gear light (never seen this one)
1L	Clutch switch
1M	Ign-signal trailing coil
1N	CAS-green wire
1O	Milage- Switch
1P	CAS black wire NE-Signal
1Q	CAS white wire G-Signal
1R	P/S switch
1S	Solenoid port air
1T	CAS red wire ground
1U	Trailing coil (select Signal) this is why we need FD igniter!
1V	Leading coil (Ignition timing signal)
1W	Heat hazard Sensor
1X	Trailing coil (Ignition timing signal)

2A	V-Ref
2B	Boost Sensor
2C	Ground
2D	O2 sensor
2E	Air-flow-meter
2F	Variable resistor
2G	Throttle-Body sensor
2H	Athmospher Sensor
2I	water Thermo Sensor on A/C cars
2J	Airflow-meter
2K	Solid Air solenoid
2L	Intake Air Temp Sensor
2M	Solenoidl Pressure Regulator
2N	EGR Solenoid Valve
2O	Solenoid Switching Solenoid
2P	Relief solenoid valve
2Q	Bypass Air Control valve
2R	Ground

3A	Ground
3B	Starter switch
3C	Injector Primary Rear Rotor
3D	Inhibito Switch
3E	Injector Primary Front Rotor
3F	Injector Secondary Rear Rotor
3G	Ground
3H	Injector Secondary Front Rotor
3I	Main Relay
3J	12V

I do not recommend to use the original wiring loom on series4. The excessive heat under the bonnet will make the original wiring brittle and failure prone, it is highly recommended to make a new wiring loom to make sure, all the wires are properly connected and all the electrical joins are solid. If your wiring was recently replaced by a new, or you know your wiring is in good condition, you don't need to perform the wiring change.

### To remove:

When you decide to make your own wiring loom, you can remove following sensors and parts, you will loose the option of twin scroll turbo control.

- AFM (air- mass- flow- meter)
- Stock Series4 MAP-sensor
- BAC valve (install a block-off plate)
- solenoids for emission control and twin- scroll function.
- Variable resistor which is installed near the MAP sensor
- All emission relevant components.

### CAS:

Make sure you use shielded wires from the ECU to the CAS. This wires are very important for ignition control of the ECU. Electrical devices like igniter, plug- wires and ignition coils may influence the CAS signal which may lead to improper timing control and engine damage. For this reason, please do not use regular wires for CAS use shielded wires instead. You can solder the green and the red wire together, them are connected to 4H pin on Apexi PowerFC. Make sure, the black and the white wire for NE+ and G+ are connected properly. Please pay special attention to the connectors which will join the CAS and the wiring. On the CAS side of connector the wires red and green are used for NE+ and GE+ on the wiring side to the ECU the colour will change to black

Version	Changes note	Date	by:
1.0	Initial release	October 20, 2006	Iwan Keller
1.1	See version history	January 28, 2007	Iwan Keller

(NE+) and white (G+).

### Injectors:

As Series4 has low impedance injectors by default, you need to splice 10 ohm resistors with at least 10 watts into the wiring. You should do this on the wires going from the ECU and not on the 12V main line. Try to install the resistors inside the car, not inside the engine bay, try to keep them away from the engine heat.

Few Series4 cars made for European market were equipped with high impedance injectors. Please check your injector impedance first.

### Apexi PFC Pinout:

Let us take a look of the wires we need to install, the wires necessary for engine to work and some nice features used by Apexi ECU are bolt:

FD ECU #4				FD ECU #3				FD ECU #2				FD ECU #1																									
4Y	4W	4U	4S	4Q	4O	4M	4K	4I	4G	4E	4C	4A	3O	3M	3K	3I	3G	3E	3C	3A	2K	2I	2G	2E	2C	2A	1U	1S	1Q	1O	1M	1K	1I	1G	1E	1C	1A

4Y	Injector Primary Rear						
4Z	Injector Secondary Front						

solder all the necessary wires from the diagram into your loom, not matter if you build your own loom or using the existing wires. Always use heat shrink tube for soldering points and tape all your connecting- points. Check for solid ground when installing electrical devices.

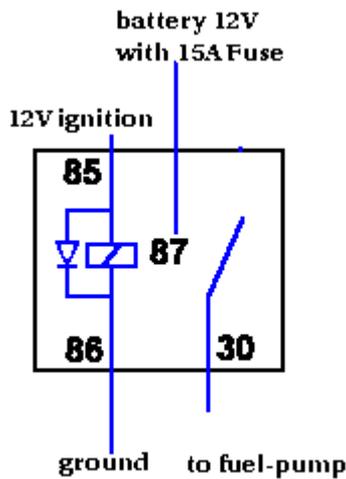

### TPS:

The TPS on the Series4 is a full range type. There is no narrow- range TPS on series4, so the narrow- range signal is not used. The PIN 3G on Apexi PowerFC is the only one which needs to be connected. PIN 3F is not used for series4.

### Fuel-Pump:

The fuel-pump relay is not controlled by the ECU for unknown reason. I recommend to install a new relay and replace the old fuel-pump wiring with new solid one. In this case, you can remove the fuel pump resistor mounted on the right side of your car near the right head-light.

Version	Changes note	Date	by:
1.0	Initial release	October 20, 2006	Iwan Keller
1.1	See version history	January 28, 2007	Iwan Keller

For Bosch type relay use the 87 for battery with a 15A fuse, the 30 should go to the fuel-pump, the 85 to ignition 12V and the 86 to ground. Every time you turn the ignition on, the pump will start working. Do not use the output of the PFC for fuel pump relay it will not work.

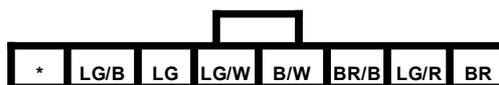

### Igniter:

You need to use FD igniter for FD3S PowerFC version. As the FD igniter has no tachometer-output as you have it on the trailing coils on second gen, you have to solder the 2B signal from Power FC into the tachometer input on the FC harness (yellow with blue stripe wire on the trailing coil pack wiring.)

Now, install the FD igniter. Take care about the right wiring! **Do not use FC igniter!**

Using the FC stock igniter will result in no spark at rear trailing plug as there is no 1V select signal from the ECU to control the spark on second trailing spark, only front trailing spark will fire but not the rear one. Also, your tachometer will read half the real RPM value. **USE FD IGNITER!**

### Wiring for FD igniter.

<p>*  <b>B/W</b>  <b>LG</b>  <b>LG/B</b>  <b>LG/W</b>  <b>BR/B</b>  <b>LG/R</b>  <b>BR</b></p>	<p>To ECU  To coil  To coil  To ECU  To coil  To ECU</p>	<p><b>Not Used</b>  <b>12V Ignition</b>  <b>1H</b>  <b>Leading</b>  <b>Trailing 2</b>  <b>1J</b>  <b>Trailing1</b>  <b>1G</b></p>
--	--	---

Version	Changes note	Date	by:
1.0	Initial release	October 20, 2006	Iwan Keller
1.1	See version history	January 28, 2007	Iwan Keller

The FD igniter comes as a box, with male connector build in. So you need a wiring loom with connector, or you can use hot-glue-gun as I have done on my own car to secure the connector- pins. Please make sure, the pins don't touch each other! Use shielded wires for igniter installation and shielded wires from the igniter to the coils.

At this point, I have decided to remove my 21 years old coils (my car is build in nov. 1985!) and replace them with FD coils I had lying around at my workshop. I have also installed MSD6A for my leading coil to improve the spark capability past 3500RPM.

After you've done, check the wiring! When you've done, check the wiring again! Always solder the wires and use shrink tube and tape, lots of tape!

#### **PFC MAP:**

The stock FD3S map may not work on Series4, so you will need to make some changes to the stock map of your PowerFC to suit Series4. You can do it only using the Power- Excel software from Apexi or Datalogit. I can send you my map on request, but some adjustments are needed even to my map, as every engine is different.

You will need to take special care to ignition timings! Mazda changed the design of Rotorhousing at the change from s4 to s5. FD timings are to advanced for 13B-T engines!

Version	Changes note	Date	by:
1.0	Initial release	October 20, 2006	Iwan Keller
1.1	See version history	January 28, 2007	Iwan Keller

**Spark- Check:**

After you have checked you wiring, you should check for spark. Remove your trailing leads and connect them to spark plug which is not installed. Start the engine and get the plug to ground at chassis. You should see the spark coming from the sparkplug on T1 and T2. If you car do not start, check for spark on leading side, the same way you can do it on the trailing side, just by cranking the car without starting.

## Series5

**Parts needed:**

Much easier than on Series4, but still some work to do.

Let us start with the parts needed for our ECU change.

- Apexi PFC FD3S I~III version for cars made between 10.1991 and 12.1995
- FD3S Air-Temp sensor and connector
- FD3S igniter
- FD3S MAP sensor or GM 3BAR map- sensor

**History:**

much less parts needed than on series4. Well Mazda changed many things since 1989! With Comso engine introduced and changes to production of series5 RX-7 are main steps into the development of the third Generation RX-7. The engines

13B – RX-7 second gen.

13B- REW Cosmo engine,

13B-REW FD engine

them all, have some things which are equal. Let us take the rotors, them are the same and some of the ECU internals are same as well. So the second gen RX-7, the Cosmo and the third gen RX-7 are the best cars for the workshop, as many parts are interchangeable. This is the reason, why we do not need so many things for our Power FC installation.

However, we still need FD igniter, FD air-temp sensor and the map sensor.

**Sensors:**

First you should remove your I/C and the UIM to get access to the sensors and the wiring loom.

Replace the water-temp sensor with the FD sensor. Remove your air-temp sensor and replace with the FD sensor (you will need to tap new thread as the FC thread is something like M8x1,0 and the FD is M8x1,25)

**TPS:**

The TPS on the Series5 is a full and narrow- range type. Please use PIN 3G on Apexi PowerFC for the full- range and PIN 3F for narrow range. You can also refer to the wiring diagram bellow to change the pins on your existing wiring loom.

**Diagram:**

The installation is described on the [www.banzai-racing.com](http://www.banzai-racing.com) website including all the diagrams and the PIN-OUT of the wiring. Here is a copy of the diagram.

- 1P FC Heat Hazzard Sensor
- 2P FC Air Pump Relief Valve

<b>Legend:</b>	<b>Notes:</b>
<== Denotes Direction of Connection	FD ECU #1 is identical to FC ECU #1
SS Speed Sensor	FD ECU #2 does not exist on FC ECU
* Denotes No Change	FD ECU #3 is identical to FC ECU #2
. Denotes Unused	FD ECU #4 is identical to FC ECU #3
Note: Only Plug #2 will have to be sourced from an FD Harness. However if you are not concerned about the Heat Hazzard Sensor in the floor, or running a Smog Pump, Plug #2 can be omitted.	

**Igniter:**

Banzai-Racing.com do not cover the installation of FD igniter but we need the FD igniter, as the FC igniter is not able to fire the rear trailing plug due to missing of 1V select signal from the ECU. Also, Cosmo igniter will not work with PowerFC for FD3S. You need to perform the same changes to ignition as on series4, so please refer to the series4 section. You can use FC coils with FD igniter, or install FD coils or any coil you prefer. Also, CDI ignition is a good mod at this point. Always use shielded wires from igniter to the coils. To install all other connectors, please use the wiring-diagram from the banzai-racing website, it shows all the wires which you need to change on the series5 harness.

**Wiring loom/ Injectors:**

I still recommend to build your own wiring for your engine, even on the series5. Please always check your injector impedance, even on series5. PowerFC can not handle low- imp injectors, so you need to change to high impedance, or install resistors into the loom.

**Fuel-Pump:**

Please install new solid wires for your fuel pump and install the fuel- pump relay the same way as for series4.

**PFC Map:**

The stock FD3S map may not suit s5 engine, so you need to perform some major changes to the

Version	Changes note	Date	by:
1.0	Initial release	October 20, 2006	Iwan Keller
1.1	See version history	January 28, 2007	Iwan Keller

map. You will need to do so using Power Excel or Datalogit. I can provide a basic s5 map on request, but minor changes are still required as all engines are different.

**Troubleshooting:**

After you have checked your wiring, you can start your car. If your car doesn't start, check your wiring again. After you have performed all the inspections but your car still doesn't start, try to follow this guide:

Check for RPM at crank. Use Datalogit and check if the ECU sees the right signal from CAS at crank. Datalogit should read about 250 RPM at crank. If Datalogit doesn't display anything, you should check your CAS wiring. Pay attention to the connector between the CAS and your wiring loom. Remember, on the CAS side, the red and the green wires are signal wires, whereas the two black wires are ground. On the harness side, the colour will change! Now we need to look at the black white wire (it should join the red, green on the CAS wiring) and not for the red green, as the red green on the loom side is connected to the ground (the two black wires on the CAS).

Check for right installation of FD igniter. Remove your leading spark-lead and connect it to spark plug (not the installed one). Crank the car and take the spark to chassis and look for spark. If you have no spark, check your igniter installation. Perform same check with both trailing sparks.

Fuel pump: Well, the best way is to listen for the fuel pump noise. If you can not hear anything, check your wiring and your new relay.

After you have done the installation, you should have something like this:  
ECU installed....!

Version	Changes note	Date	by:
1.0	Initial release	October 20, 2006	Iwan Keller
1.1	See version history	January 28, 2007	Iwan Keller

OK now, turn the ignition “on”

Version	Changes note	Date	by:
